

Swath Manager

Automatic Boom Section Control

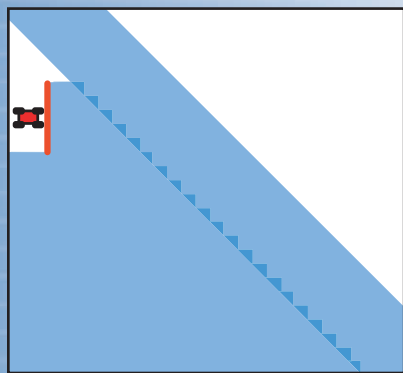

Improve the efficiency of your product applications, decrease operator fatigue and cover more acres in a single day with Swath Manager. You choose the amount of overlap - 0%, 50% or 100% - and let Swath Manager take over.

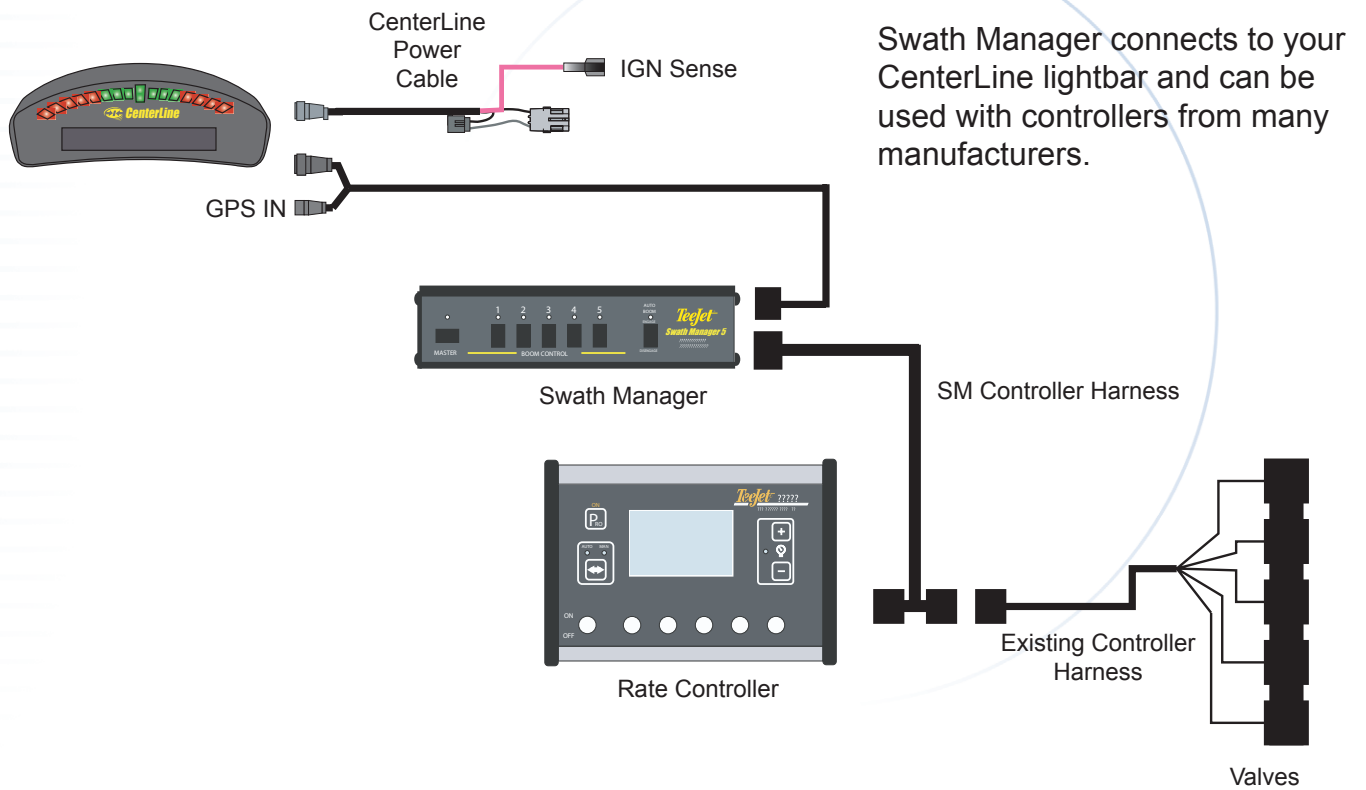

- Boom sections are switched on and off automatically according to preferences.
- Decrease overlaps to reduce product costs and eliminate skips and the need for reapplication.
- Easy manual override option in case you determine a quick change in overlap is required.
- Automatic operation eliminates the guesswork on point rows and ensures proper application.

Swath Manager is compatible with the CenterLine lightbar guidance system and can control up to 10 boom sections. An easy and economical upgrade, just plug Swath Manager in and upgrade your CenterLine software. Set-up takes just a few minutes and you're ready to start product application.

Swath Manager can interact with almost any system containing solenoid or ball valve shutoffs, including controllers from other manufacturers.

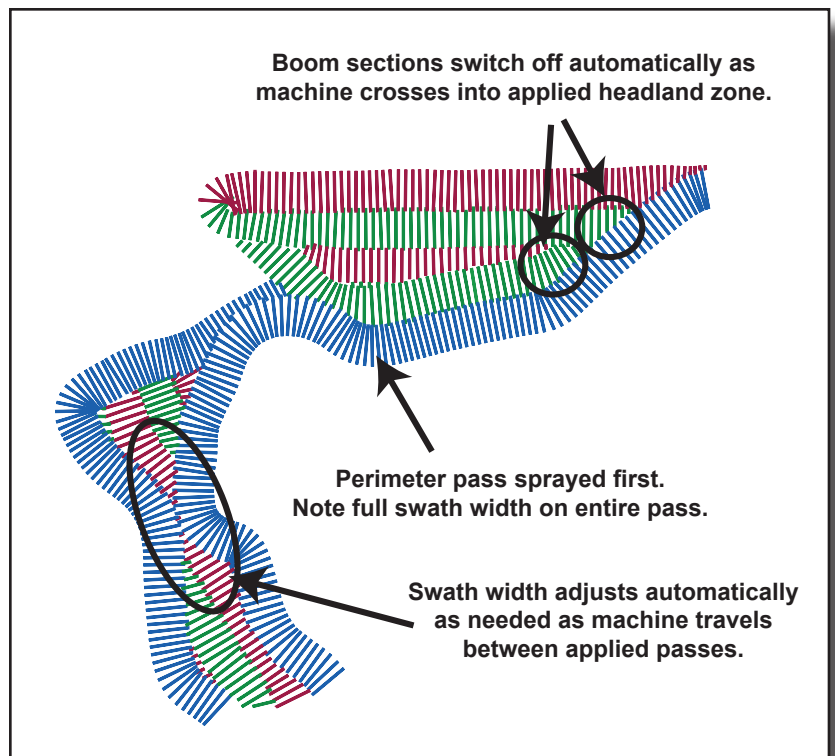

Example of coverage with Swath Manager using 100% overlap setting.

How to Order

Description	Upgrade to existing CenterLine	Complete Kit with CenterLine and RX 370p
